## Mobile App Development:-

### i) pubspec.yaml:-

The pubspec.yaml file contains metadata about your project, such as the project's name, version, description, dependencies and other settings. It's crucial for managing the libraries your project relies on and also for specifying the environment, assets and other settings.

### ii) Dependency:-

Dependency refers to an external library, package or module that your project relies on the function properly. These dependencies provide additional functionality that you don't have to build from scratch, allowing you to save time and effort.

### iii) Gradle:-

Gradle is a build automation tool used in Android development to automate tasks like compiling code, managing dependencies, packaging apps and running tests.

### iv) API:-

An API is a set of rules, protocols and tools that allow different software applications to communicate with each other.

### v) Rest API:-

A Rest API ~~Transfer~~ is a set of rules and conventions for building and Interacting with web services. It uses HTTP requests to perform operations on data, typically in the form of resources, which can be accessed, created, updated or deleted.
